Level sets of Migkas R_A^2 & R_B^2 | ST+Gauss, AF=hratio, $\rho(D) = \Omega_m \rho_{\rm crit}$

What each dial does (baseline $\star$: $D/L = 5.9$, $f_u = 0.94$, $\kappa \approx 0.23$, Amp $= +0.07$, $\phi \approx 213^\circ$, $\alpha = 1$, $d/D = 0.1$; $\rho(D) = 0.3\,\rho_{\rm crit}$ always).

- D/L & f_u: set the two-scale density shape $\Rightarrow$ tidal amplitude (frac ptp) and enclosed-mass $\kappa = GM_{\rm enc}/(D^3H^2)$ (white dashed = κ contours).
- α: overall gravity / peculiar-velocity strength (scales $H_{\rm obs}$ anisotropy).
- d/D: observer offset $\Rightarrow$ multipole mix in AF/AN (dipole vs higher).
- ϕ: aims the Amp×sin template on the sky (phase / axis). $\mathrm{Amp}_A/\mathrm{Amp}_B$: template depth on A vs B (shared ϕ; re-fit per cell on profile panels).
