Sedov–Taylor CoE term matching at fixed D/r (sources on the vision shell, d = r): numeric ideal-drag model vs analytic point-mass form
Rotation φ_1 shifts the m=1 harmonic, 2ℓ phase φ_2 shifts m=2; octupole left at its natural phase (ℓ_0 = 14.96° = data m=2 peak). * = parameter at fit bound

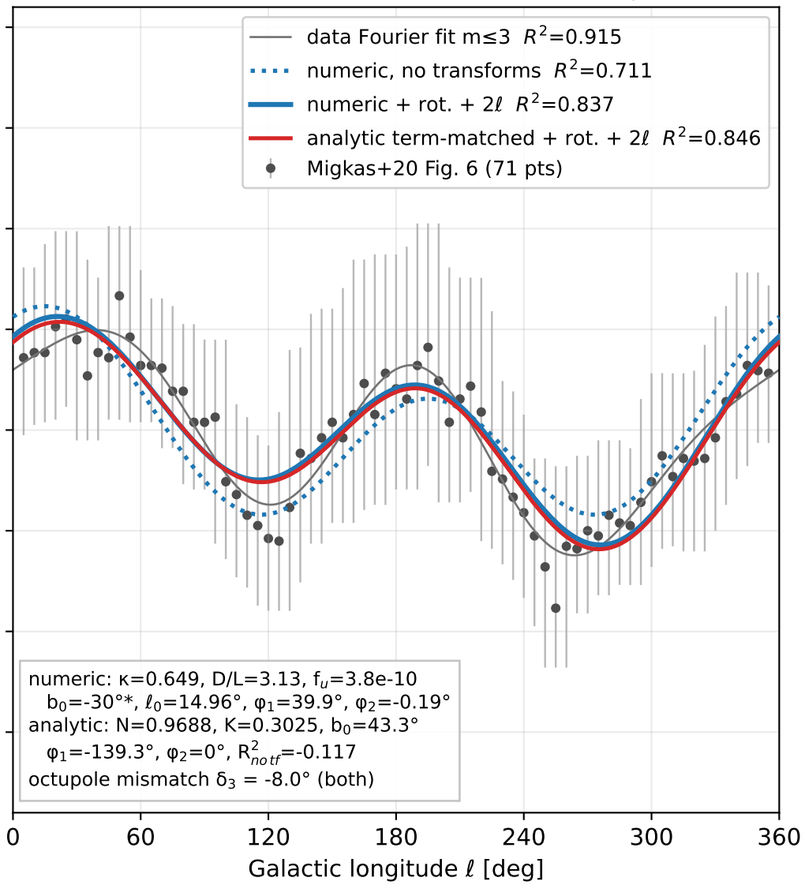

D/r = 2 (ε = r/D = 0.500, D = 28.6 Gpc)

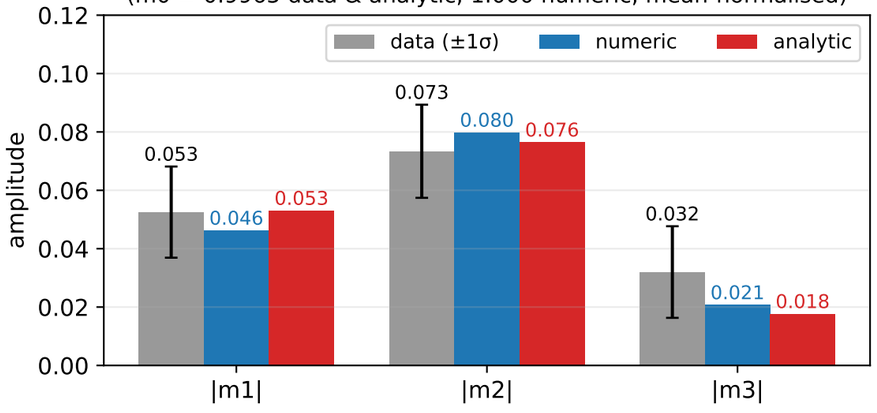

D/r = 3 (ε = r/D = 0.333, D = 42.9 Gpc)

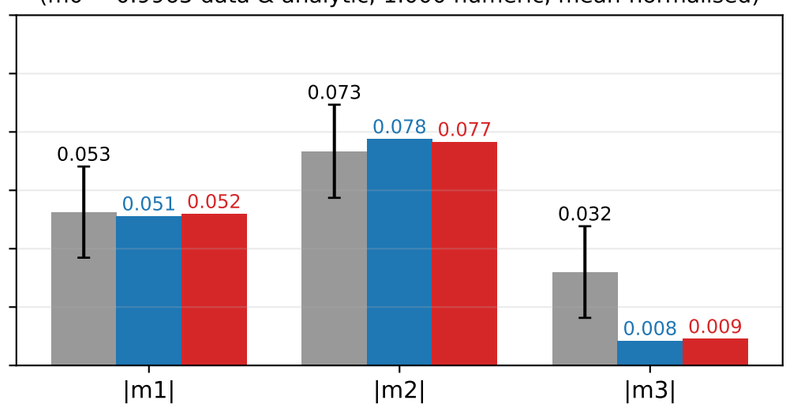

D/r = 4 (ε = r/D = 0.250, D = 57.2 Gpc)

D/r = 2: harmonic amplitudes
(m0 = 0.9965 data & analytic; 1.000 numeric, mean-normalised)

D/r = 3: harmonic amplitudes
(m0 = 0.9965 data & analytic; 1.000 numeric, mean-normalised)

D/r = 4: harmonic amplitudes
(m0 = 0.9965 data & analytic; 1.000 numeric, mean-normalised)
